

ASSIGNMENT

Objective

Your objective is to implement a simple API for a school's homework submission platform that enables students to submit their homework and teachers to grade students' submissions. Please spend about 3-4 hours on the assignment.

Brief

Using Python, your challenge is to build a REST API for a school's homework submission platform. You are expected to design any required models and routes for your API and document your endpoints.

Tasks

- Implement the assignment using:
 - Language: Python
 - Framework: Any Python framework (we use Django Rest Framework, but this is not a requirement)
- There should be API routes that allow students to:
 - Submit their homework
 - View their homework submissions
 - Filter by grade (A - F, incomplete, ungraded)
 - Filter by assignment name
- There should be API routes that allow teachers to:
 - See an overview of all homework submissions
 - Filter by assignment name, date range (to - from), and individual student name
 - Grade individual homework submissions (A-F, comments)
- Add unit tests for your business logic

Each homework object should minimally include the following fields:

- Assignment
- Student
- Submission date
- Grading date
- Assignment
- Final grade
- Teachers Notes

Evaluation Criteria

- Python best practices
- Completeness: Did you include all features?
- Correctness: Does the solution perform in a logical way?
- Maintainability: Is the solution written in a clean, maintainable way?
- Testing: Has the solution been adequately tested?
- Documentation: Is the API well-documented?

Code Submit

Please organize, design, test, and document your code - then push your changes to Git.

Please send us the code at least 24 hours before the scheduled code review so that the team has a chance to review the project.

All the best and happy coding,

The Stride Team
